

AT220 self-resetting trap

How does it work?

The AT220 is a self-resetting kill trap that targets possums and rodents. It is manufactured in New Zealand by NZ AutoTraps.

The trap is powered by an electric motor and rechargeable battery, lasting up to 3 months before needing to be changed.

Mayonnaise lure is automatically pumped by the motor into the lure tray. This draws the pest animals up toward a photoelectric sensor that triggers the trap.

After the trap fires, carcasses are dropped to the ground and the motor resets the device so it's ready for the next catch.

What does it target?

The AT220 is great at controlling possums and rodents. It uses a mayonnaise-based lure to draw these predators into the trap.

The auto-resetting feature makes this trap highly effective at killing multiple animals within a short space of time and requires less effort than manual traps.

Is it humane?

The traps meet animal welfare standards set by the National Animal Welfare Advisory Committee (NAWAC).

Is it safe for pets and people?

The device is equipped with daylight 'lockout' sensors and will only trigger at night. The trap doesn't contain toxins or poisons. We recommend keeping pets indoors at night and encouraging kids not to touch the traps.
